Daily Sun: 11 January 2023

There are four active regions AR3181, AR3182, AR3184 and AR3186 present on the Sun capable of producing strong M and X-class solar flares having chances of 26% and 3% respectively. No Coronal Hole (CH) is detected on the solar disk.		
DISCUSSION:

Solar activity is expected to be at moderate to high levels. Multiple M and X flares have already occurred from the regions mentioned which caused shortwave fadeouts. In case of more M/X flares, minor to moderate radio blackouts may be observed which may last up to 90 minutes. Low solar wind speed and quiet to unsettled geomagnetic activity is expected. HF conditions are enhanced.
