LATEST SOLAR CONDITIONS

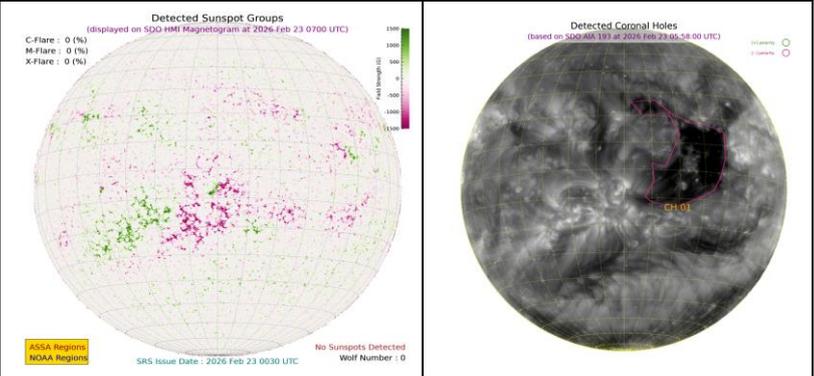

Sunspot Number (SN)	0
Solar radio flux (F10.7)	110 sfu
Solar wind speed	718.6 km/s (varied in the past 24 hrs between 519 & 761 km/s)
Solar x-ray flares	B3.2 (max flare in the past 24 hrs (C1, 1640 UT)
Interplanetary Magnetic Field (IMF) Total Field (Bt) Z Component of Field (Bz)	+6.13 nT (varied in the past 12 hrs between +5.75 nT & +7.17 nT) -0.11 nT (varied in the past 12 hrs between -4.81 nT & +4.75 nT)

Solar conditions are at low levels with background X-ray flux at B-class level.

Daily Sun: 23 February 2026

There is no active region present on the Sun capable of producing strong solar flares.

One Coronal Hole (CH) is detected on the solar disk.

DISCUSSION:

Solar activity is expected to be at low levels. In case of M/X-class solar flares, minor level HF radio blackouts may be observed. Slightly elevated levels of solar wind speed are expected to prevail due to the effect of coronal hole high speed stream (CH HSS). Quiet to unsettled levels of geomagnetic activity is expected. HF conditions are expected to be normal.
